

Welcome to Bannr Lite! An HTML/CSS generator for Photoshop.

To begin, click on the “Scan” button on the left hand navigation bar.

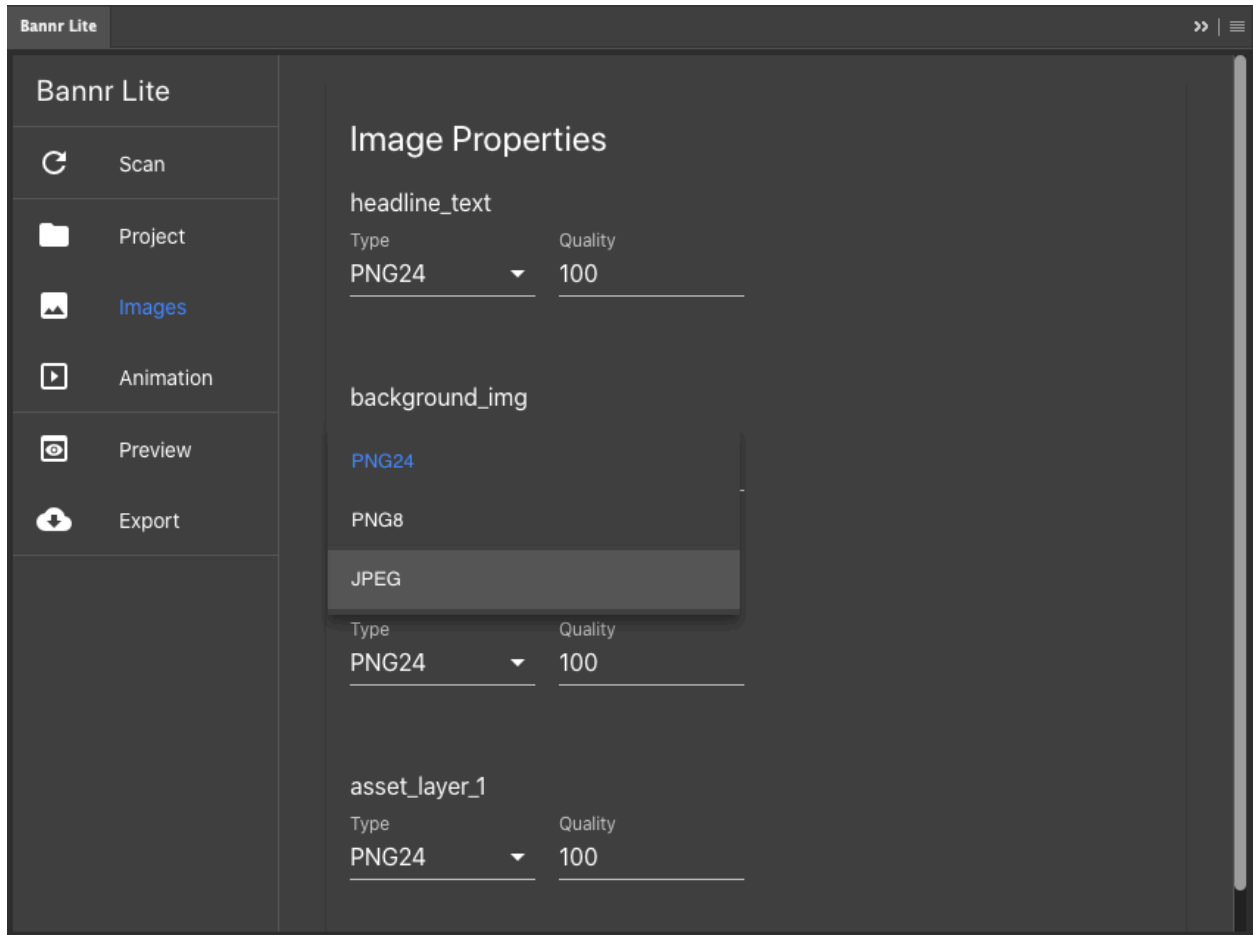

Scan will read your active PS document and fetch all the required information to convert your document to HTML.

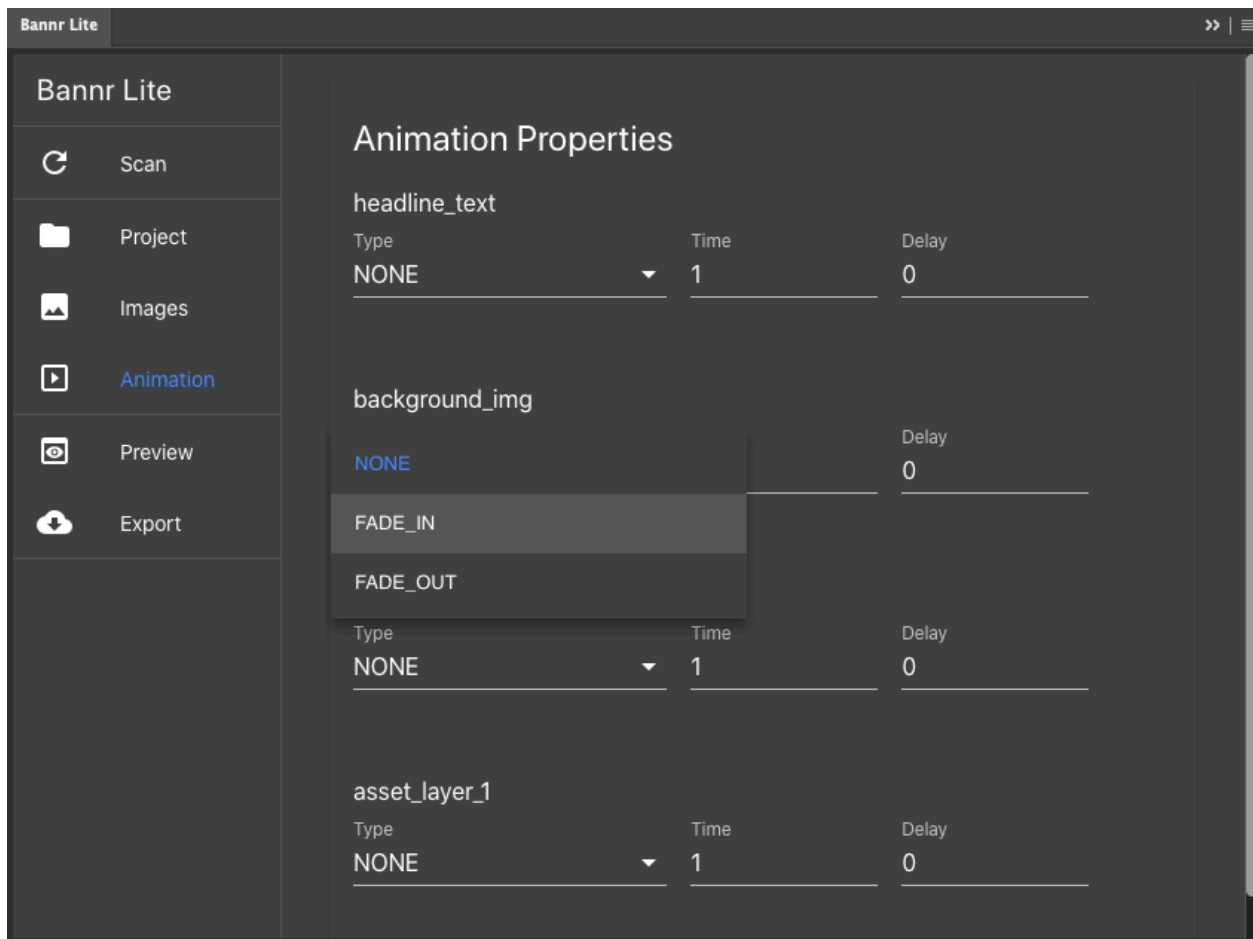

The Project pane allows you to add an optional click url and border. The click url will be opened in a new tab or window when a user clicks on your asset. The border color defaults to grey, but can be changed or removed entirely.

The image pane allows you to customize the images being exported. By default, PNG 24 bit is used with a maximum quality of 100 (1-100). You may select lower quality PNG8 or JPEG should you desire.

The animation pane allows you to apply animation to each layer or layer group. Select the animation type from the drop down. The “time” value represents the duration over which the animation will take place (in seconds). The “delay” value allows you to add a delay to the animation start time (also in seconds).

**Preview:** The Preview button allows you view your project in your default browser. When clicked, it will export your project to your Documents (OSX) or My Documents folder (Windows) in a subdirectory named ‘Bannr’.

**Export:** The Export button will render your project, and bundle them into a single zip file. This zip file will be placed in the same subdirectory as your preview files, and it will contain the same name as your PS document.
